VACUUM PACKAGING CYCLE

A vacuum packaging machine enables you to extend the shelf life of food products, and to protect and preserve the quality of food and non-food products. The vacuum packaging cycle has 4 steps.

1 EXTRACTION OF AIR

The air is extracted from the product, the bag and the chamber up until the pre-set time or vacuum percentage has been reached or the boiling point has been detected.

2 GAS FLUSH (OPTION)

Also called Modified Atmospheric Packaging or MAP. Adding a gas offers extra protection and prevents the product from coloring. It's usually a gas mixture.

3 SEAL

The right seal system protects products effectively against external elements. Depending on the type and thickness of the vacuum pouch, and your packaging needs.

4 AERATION

Once the bag has been sealed, the air is brought back into the chamber. As soon as the pressure in the chamber equals the pressure outside, the lid opens.
